

Pop Goes the Window

Take a look at the broken rear window of this car. Think it was shattered by a hail storm ... kids playing ball ... gun shots?

Nope, nope and nope. If you click on the photo to enlarge, you'll see the culprit: a pressurized can that exploded under the heat. Thus the reason for that warning on the sides of cans, "Do not expose to heat or store at temperatures above 120 degrees, as container may burst."

Did you know that even with your windows cracked, at 93 degrees Fahrenheit, the inside temperature of your car can reach 125 degrees in 20 minutes, and 140 degrees in 40 minutes?

If you must store a pressurized can in your car, make it some air freshener, so your car will smell good when you have to clean up the mess.
